# Introduction Motor Graders

ITR offers a wide range of cutting edges for motor graders. Each provides certain benefits when used in the appropriate application. ITR offers three types of grader edges curved, flat, and serrated.

**Curved Edges** are primarily used in grader or plow applications. They provide the superior penetration and rolling action necessary for fine grading and finishing work. All ITR curved edges are developed to provide the best penetration and to stay sharp longer. ITR grader blades are supplied both in BORON and HIGH CARBON steel.

**Flat Edges** are usually wider and thicker than curved edges because they are designed for more demanding applications, applications like road maintenance. ITR flat edges provide better abrasion and higher impact resistance.

Pag. A2-A5

**Serrated Edges** are designed to loosen hard-to-penetrate materials such as packed gravel, frozen earth, and ice. Because of their ability to penetrate quickly, serrated edges may last longer in some applications. Serrated blades may be flat or curved. The teeth are made with standard width and gap spacing (depends on the thickness and size of the edge).

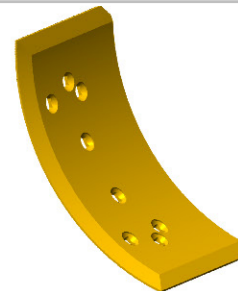

Most moldboard damage can be avoided through routine monitoring of cutting edge wear and timely edge replacement. In order to protect the moldboard ITR offers the following:

**Moldboard End Bits** are recommended for all applications. ITR developed a high performance moldboard end bit in order to add maximum strength and service life, and to give the best wear protection to the moldboard edges.

Pag.A6

**Overlay End Bits** are recommended for applications such as ditching that cause severe wear on the cutting edge and moldboard corners. They add strength and limit corner wear, which extends cutting edge life when an edge would otherwise be thrown away due to excessive wear at the corners. ITR offers flat or curved overlay end bits, depending on the blade used. When worn on one side, curved overlay end bits can be rotated for a second wear life.

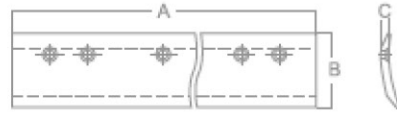

Pag.A7
